CCM Marine - Combustion Monitoring Systems

CCM is an easy to use plug and play system, which enables in real time data acquisition of cylinder pressure on engines. Data can be recorded from up to 20 cylinders for closed loop control applications and to diagnose malfunctions or to assist in the setting and optimising of engine parameters e.g. balancing cylinders.

CCM Marine is a modern system for advanced engine balancing on 2- and 4-stroke marine diesel engines. At the centre of the efforts is cylinder balancing – the equalisation of output across all cylinders. Well balanced engines minimise fuel consumption between 2% and 3%. The smoother engine running will decrease wear and tear in the engine.

As an additional benefit, emissions of the greenhouse gas carbon dioxide can be reduced by some 2% which is of high importance in times where environmental regulations are becoming increasingly stringent (e.g. IMO TIER III limitations in Emission Control Areas).

We offer fixed and portable CCM systems for diesel and gas engines.

Combustion control Module CCM

The main component of our CCM systems is the combustion control module. It is a smart combustion signal processing device for marine engines and stationary gas engines. Its function is to acquire and process in real time data from cylinder pressure sensors. Every combustion cycle will be evaluated on every cylinder for to calculate key parameters engine builders need to implement cylinder pressure based control on engines.

CCM is designed as a plug and play module, that means CCM communicates via CAN bus with the engine control system and it can be integrated to the engine management system. A further important function is that all data can be transmitted via internet to the server of the engine operator. This enables to control the engine from land.
for continuous and periodic operation

**High precision cylinder pressure sensors**

Our various types of cylinder pressure sensors are suitable for installation on 2- and 4-stroke engines and mesh with our CCM systems. Depending on engine type we offer sensors with various thread (M8 x 0.75, M10 x 1, M14 x 1.25), various sleeve and cable length and different measuring cells.

They all convince with their long term accuracy with minimal signal drift over long periods. Designed for a minimum of 16,000 operating hours they enable the acquisition of highly accurate processable data during periodic checks and during continuous monitoring of combustion pressure.

Marine Type Approvals

Large engine manufacturers are required to fulfil numerous international safety standards. Marine Type Approval is therefore a mandatory requirement for voyage and safety critical devices installed on any ship.

Our sensor types have received Marine Type Approval from all significant international classification societies, such as Bureau Veritas, DNV GL, ABS, Lloyd’s Register, Class NK or China Classification Society.

For our combustion control module CCM, Marine Type Approval from Bureau Veritas and Class Nk are in preparation. Other approvals will follow shortly.
CCM Marine Performance

CCM Marine Performance designed for fixed and continuous operation is a system which includes a high speed data acquisition unit (CCM) for up to 12 cylinders, permanently installed cylinder pressure sensors and an advanced visualisation- and performance software.

The combustion pressure is measured on each cylinder continuously and in all speed ranges. It is easy to use as an online solution for condition and performance monitoring.

The data can be transmitted for evaluation directly via LAN / Ethernet to a PC where the CCM software is installed. The software allows an easy collection, management and comparison of engine performance data. This enables a quick overview about engine condition for an optimal engine performance. It is also possible to transmit the data via satellite to the server of the engine operator. This allows engine control from land and the active regulation of emission as well as cost optimisation.

Installation of two-stroke combustion sensor TCS-01CA including adaptor on a Wärtsilä 6 RTFLEX84 engine
for fixed and continuous operation

CCM Marine Performance can be directly installed at the engine. A sophisticated plug- and play concept enables an easy fitting of cylinder pressure sensors and pulse inputs to the CCM housing.

Main components:

1. Combustion Control Module CCM - high speed data acquisition unit
2. Terminal box with 10 or 12 connectors for IMES pressure sensors
3. IMES high precision cylinder pressure sensors - various types for 2- and 4-stroke engines available
4. Magnetic pick-up for TDC signal
5. PC / Laptop with installed data acquisition- and visualisation software and performance evaluation software

System overview - example for connection to 6 cylinders
CCM Marine portable

CCM Marine Portable for periodic operation is a multi cylinder combustion monitoring system for 2- and 4-stroke marine diesel engines. It is designed as a portable box, a comprehensive, transportable system which can be rapidly installed on-site to enable acquisition of cylinder pressure data on engines in the field. Data can be recorded from up to 20 cylinders.

The easy installation of CCM Marine Portable enables a quick data acquisition. The recorded data can be transferred via Ethernet to a PC where the data acquisition and visualisation software can be used to diagnose malfunctions or to assist in the setting and optimising of engine operating parameters. At the centre of efforts is cylinder balancing - the equalisation of output across all cylinders of an engine.

for advanced engine balancing

The easy installation of CCM Marine portable enables periodic simultaneous balancing of all of an engine's cylinders in the field.

Main components and technical data:

1. CCM Marine portable box
2. Terminal box with 10 or 12 connectors for IMES pressure sensors, option: extension to 24 analog inputs
3. IMES cylinder pressure sensor: various types for 2- and 4-stroke engines available
4. Reflective sensor: Pick-up sensor providing a position signal from crankshaft or camshaft
5. PC / Laptop with installed CCM Visualisation software connected via 100Mbit/s industrial Ethernet cable
6. Wide range power supply: 90...264 VAC
Advanced visualisation software

The CCM Marine PC software is a modernised version for online combustion monitoring on marine diesel engines. The recorded data can be used to diagnose malfunctions or to assist in the setting and optimising of engine operating parameters. It offers the possibility of selecting advanced monitoring functions in the following diagrams and reports: *Pressure curve diagram, Pmax and Pcomp diagram, Pmax balance, Pressure volume diagram, Engine report*

Event Record

CCM Marine offers an event storing, this means that a large memory buffer records combustion data and pressure curves from the latest 40 cycles on 4-stroke engines or rather the latest 80 cycles on 2-stroke engines. This function allows to analyse the data before, during and after a failure. This enables the engine operator to determine the cause of failure and to find possibilities how to prevent it in the future.
for an optimal engine adjustment

The visualisation data delivered can be used for much more than combustion monitoring, the main focus is periodic simultaneous balancing of all of an engine’s cylinders. Since unbalanced engines use more fuel than well balanced engines, the process has come into sharp focus at a time when shipowners are being squeezed by low freight rates and higher and higher fuel prices.

**Main benefit**

The stored data enable to adjust engine optimally. An engine report shows the measurement results of each cylinder and the complete engine as an average. The cylinder conditions can be optimised and the engine can be easily balanced and tuned in order to improve the running performance. The result is minimising fuel consumption and environmental impact and a more durable engine.

- less fuel consumption up to 3 %
- reduction of maintenance and service costs
- less costs for engine repair
- improved emissions, reduction of CO₂ and NOₓ
- engine control by the engine operator from land
IPE Performance Evaluation Software

The measured data can be transmitted to the IMES Performance Evaluation software (IPE). In addition to IMES data acquisition software it offers advanced functions to facilitate the collection, evaluation, management and comparison of engine performance data for marine diesel engines. The software evaluates the current engine performance automatically by comparing the actual ISO corrected measurement with the reference data at any load point. Due to this the user receives a quick and reliable overview on many operational aspects.

Main features
- ISO correction
- automatic evaluation of current engine performance data
- easy collection, management and comparison of engine performance data
- performance graphs and reports show deviation and suggest actions to take
- clearly illustrated commercial calculations that allow to save money by reducing fuel and oil consumption
- automatic data transfer from CCM to IPE
- pressure curve analysis software module full integrated

Performance graph showing deviation of engine performance compared to engine characteristic curve
for a comprehensive analysis of engine performance data

The chief engineer only needs to fill in the requested information so the programme can do ISO correction and compare against new engine performance benchmarks. Performance graphs and reports give a quick status of an engine and suggest actions to take for optimising engine condition. This enables extensive savings by reducing fuel and oil consumption as well as engine repairs caused by inadequately adjusted engines.

The user only has to fill in the required information in addition to the usual cylinder pressure measurement. For a quick overview regarding the engine condition a traffic light system is implemented.

For the purpose of comparison the measurements are ISO corrected and displayed as reference to the shop test.

Based on the traffic light system the valuation of the most essential operational parameters are displayed. Depending of the indication possible problems / reasons / malfunctions are given.
We deliver worldwide!

Professional support worldwide due to our global sales organisation.
